RESUMEN

La tecnología digital representa una nueva forma de entrega de cuidados en salud y es un recurso valioso para mejorar las vidas de las personas. La enorme necesidad de cuidados psicológicos hace pensar en métodos que no estén restringidos a las intervenciones tradicionales. Las aplicaciones móviles en salud se refieren a los programas en dispositivos inteligentes (teléfonos, tablets y computadoras) que pueden ser usadas para promover el crecimiento y el bienestar emocional, psicológico y físico. Lograr el acceso a los tratamientos en salud mental es un desafío y las aplicaciones móviles tienen el potencial de superar esta barrera. Además, promueven una forma innovadora de evaluar y tratar condiciones psicológicas, permiten que los usuarios tomen un rol activo en su propio cuidado, abaratan los costos, disminuyen el estigma, acortan las listas de espera y permiten una distribución más extensa de los terapeutas capacitados. Se realizará una introducción a la utilización de una aplicación móvil en contexto hospitalario con personas con diagnóstico de Síndrome de Intestino Irritable. El dispositivo tiene como objetivo que el paciente logre registrar en el momento que se presentan los síntomas, conducta, pensamientos y emociones que se encuentren asociados a este cuadro.

Palabras clave

Aplicaciones móviles - Síndrome de intestino irritable - Terapia Cognitivo Conductual

ABSTRACT

APPS IN PSYCHOTHERAPIES

Digital technology represents a new form of health care delivery and it is also a valuable resource to improve people's lives. The enormous need for psychological care calls for methods that are not restricted to traditional interventions. Health applications refers to programs in smart devices (phones, tablets and computers) that can be used to promote growth and emotional, psychological and physical well-being. Achieving access to mental health treatments is a challenge and mobile applications have the potential to overcome this barrier. They also promote an innovative way of evaluating and treating psychological conditions, allowing users to take an active role in their own care, lower costs, reduce stigma, shorten waiting lists and allow more extensive distribution of trained therapists. An introduction will be made to the use of a mobile application in a hospital context with people diagnosed with Irritable Bowel Syndrome. The objective of the device is for the patient to be able to register

symptoms, behavior, thoughts and emotions that are associated with this condition occur.

Key words

Mobile applications - Irritable bowel syndrome - Cognitive behavioral therapy
